# Application and Case Studies of four potential Wind Blade Manufacturing Process Improvements

Stephen B. Johnson

Department of Mechanical Engineering  
University of Massachusetts Lowell

GE Renewable Energy

# Topics of Presentation

---

- A Quick Refresher on Project 4.6/Phase 1
- Project 4.8/Phase 2 Objectives & Demo Project Selection
- The Four Case Studies
- Process Trials

## Two Key Deliverables

1. A comprehensive techno-economic model on wind blade manufacturing.
2. A DELMIA full factory visual discrete event simulation

# Techno-Economic Model as Delivered

- Easy Excel input/output
- Visual Basic to handle complexity
- Design linked to manufacturing
- Multiple scenario capability
- Parametric process models.
- Detailed overhead costs
- Multi-year operation
- Full product lifecycle impacts
- Balance sheet & Cash flows

**UML Wind Blade Cost Estimator**

**Cost Scenario Options**

- Baseline 61.5 Output Complete
- Pultrusion Output Complete
- AutoDegas Output Complete
- AutoFinish Output Complete
- One-Step Output Complete

**Analysis Options**

Mature Cost Only

Multi-Year, Fixed Plant, Fixed Output  
Multi-Year, Fixed Plant, Max Output  
Multi-Year, Set Output, Optimized Plant

Sets per Year: 260  
Desired ROI: 0.15

Include Mold Costs  
 Include Blade Engineering

**Inputs & Status**

ITEM	OUT	FOUND	STATUS AND RESULTS
BOM	<input checked="" type="checkbox"/>	400	Process Steps Found for All BOM Lines
Components	<input checked="" type="checkbox"/>	11	11 of 11 components will be displayed.
Tooling	<input checked="" type="checkbox"/>	8	All needed mold definitions found
Materials	<input checked="" type="checkbox"/>	168	All 33 needed materials were found.
Labor	<input checked="" type="checkbox"/>	7	All 2 needed labor types were found.
Process	<input checked="" type="checkbox"/>	174	Matched Process step to BOM in all places.
Overhead	<input checked="" type="checkbox"/>	79	3.655649E+07 yearly Overheads cost found.
Lifecycle	<input checked="" type="checkbox"/>	44	All the Life Cycle factors read in.

See the "Messages" sheet for information on items highlighted in red

**Results**

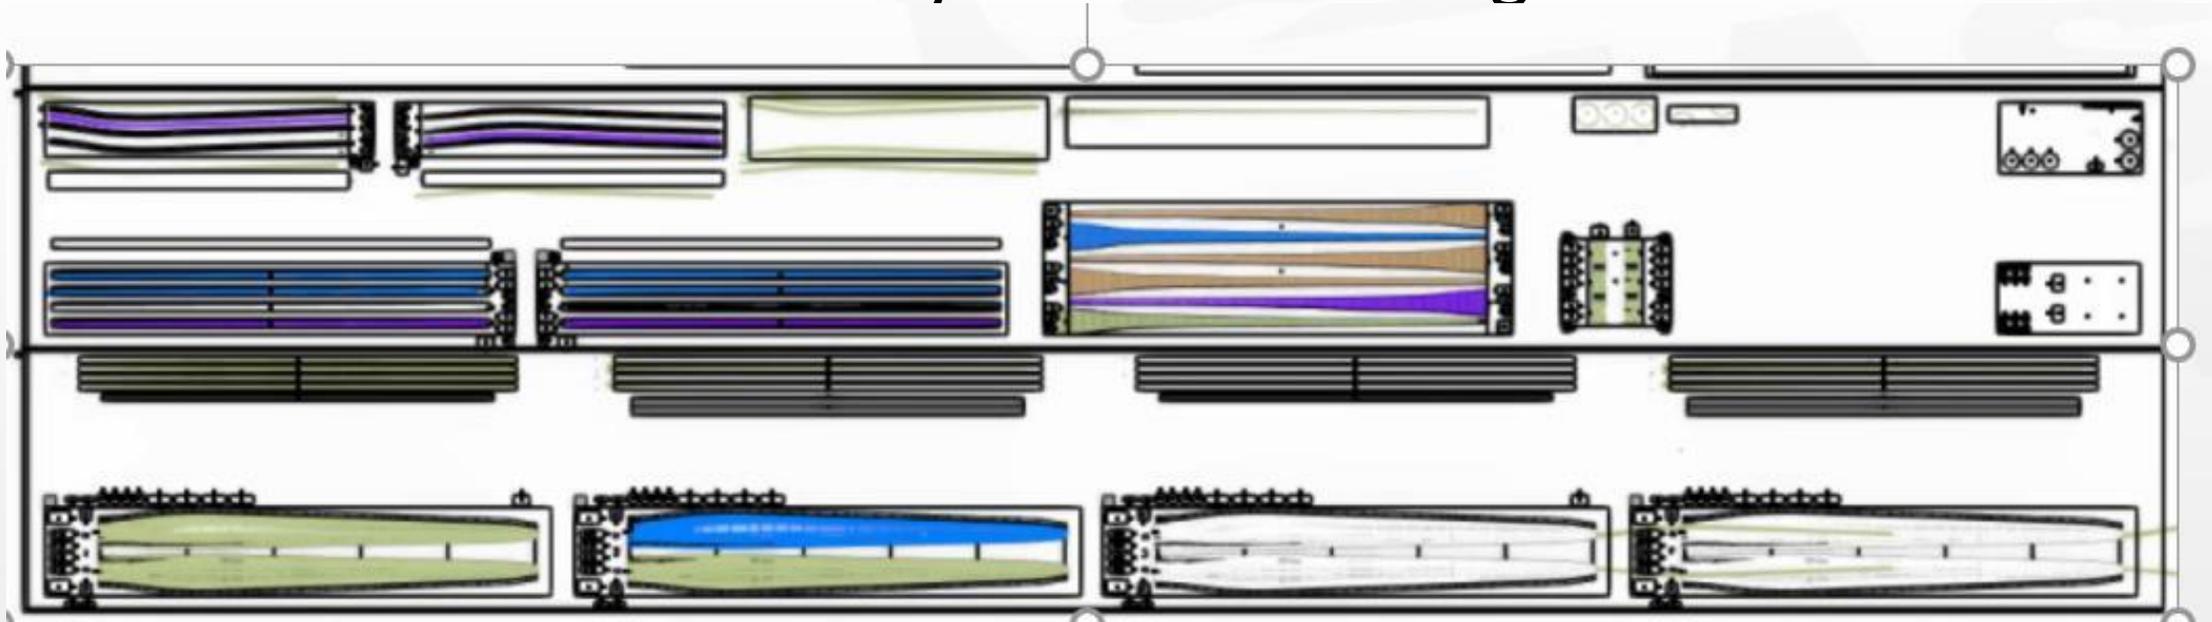

Scenario		Baseline 6	One-Step
Output Yr1/Yr2	Blades	790/780	780/780
Blade Weight	Kg	18,311	18,311
DL Hours/Blade	Hours	1,198	1,169
Shell Mold Cycle	Hours	32.1	29.0
Hourly People	People	601	586
Salaried People	People	86	86
Factory Size	SQM	32,482	30,782
Material Cost	\$/Blade	90,159	90,159
Labor Cost	\$/Blade	41,026	39,977
Overhead Cost	\$/Blade	48,608	46,194
Other Costs	\$/Blade	35,226	34,548
Net Price/Cost	\$/Blade	215,019	210,879

# Dassault DELMIA Integration

---

## Discrete Event Simulation with Visualization

- Identifies bottleneck and opportunities
- Add statistical variability to the modeling

# IACMI Project 4.8 Objectives

---

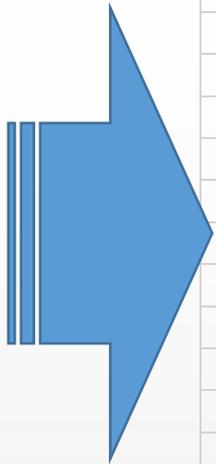

Use the tools developed in Project 4.6/Phase 1 to

- Analyze potential process improvements for blade making
- Select a project for an actual process trial
- Generate additional process detail and engineering
- Run process trials
- Compare results for trials against model predictions.

# Project Down Selection

IDEA LIST
Automated Resource Tracking & Analytics
Elimination of Shear Web Fixtures
Pultrusion replacements
Material Kitting & Scheduling
Automated Resin Degas and Delivery
Laser Projection
Reconfigurable Shear Web Fixture
Replace Epoxy with PU or PE
Automated Blade Finishing (Edge Trimming & s
Large scale preforming with vacuum & heat
Bond Shells outside of molds
Automated large-scale adhesive for close
Pixelated mold heating and cooling
Automated fabric lay down
Automated gel coating

		Idea Scoring				
		Weight	Auto Finish	Auto Degas	Pultruded	One Step
1	Time Scale	8	5	7	3	7
2	Blade Cost Impact	8	6	3	5	5
3	Model Validatation	8	8	5	5	8
4	Team Participation	8	7	2	4	9
5	Budget	5	3	8	6	5
6	Easy or Hard to Do	8	5	8	4	4
		Weighted Scoring				
			Auto Finish	Auto Degas	Pultruded	One Step
1	Time Scale		40	56	24	56
2	Blade Cost Impact		48	24	40	40
3	Model Validatation		64	40	40	64
4	Team Participation		56	16	32	72
5	Budget		15	40	30	25
6	Easy or Hard to Do		<u>40</u>	<u>64</u>	<u>32</u>	<u>32</u>
	Net Score		263	240	198	289

15 Initial Ideas → 4 Ideas → 1 Idea to Demonstrate

# Baseline Blade & Modeling

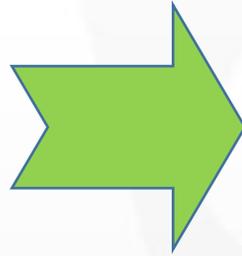

- NREL 61.5m Blade with carbon spars used in all case studies
- Four shell mold factory making 780 blades per year.
- Standard blade process except:
  - No root prefabrication
  - Prepreg assumption for spars

Metrics		
Blade Weight	18,311	Kg
Direct Labor	1,198	Hours
Shell Mold Cycle	32.1	Hours
Factory Space	32,482	Sqm
Costs		
Material	90,159	\$
Labor (Direct)	41,026	\$
Overheads	48,608	\$
Business	<u>35,226</u>	\$
Total Cost/Price	215,019	\$

# Case 1 – Automated Degas

---

- Resin needs degassing before infusion in order to minimize porosity
- Old method uses vacuum tanks, is a batch process, and takes time.
- Automated degas delivers instantaneously, and right at the mold, but needs CAPEX

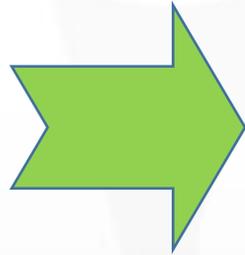

TEM Model Predicted \$298 (0.1%) Savings per Blade

## Case 3 - Automated Finishing

---

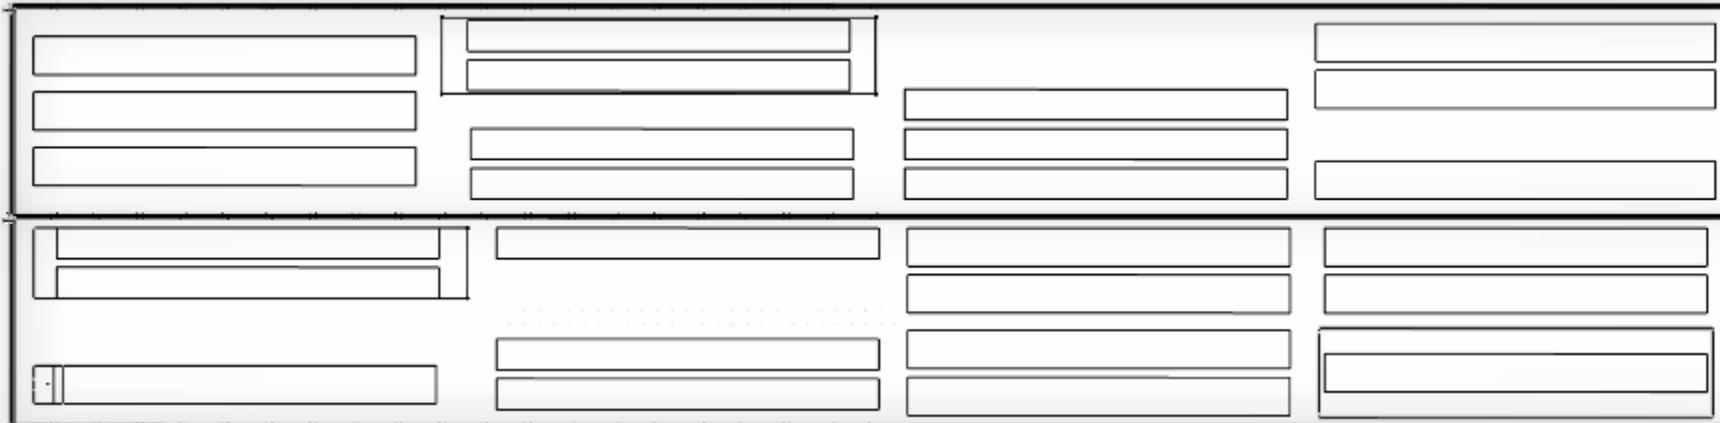

- Manual surface prep for painting takes 90 man-hours (7% of Total)
- Multiple stages: Leading/trailing edge trim and prep, main surface, root drilling
- Dirty, dust generating operations.
- Automation developed and available for these operations.

TEM Model Predicts \$3,631 (1.7%) Savings per Blade

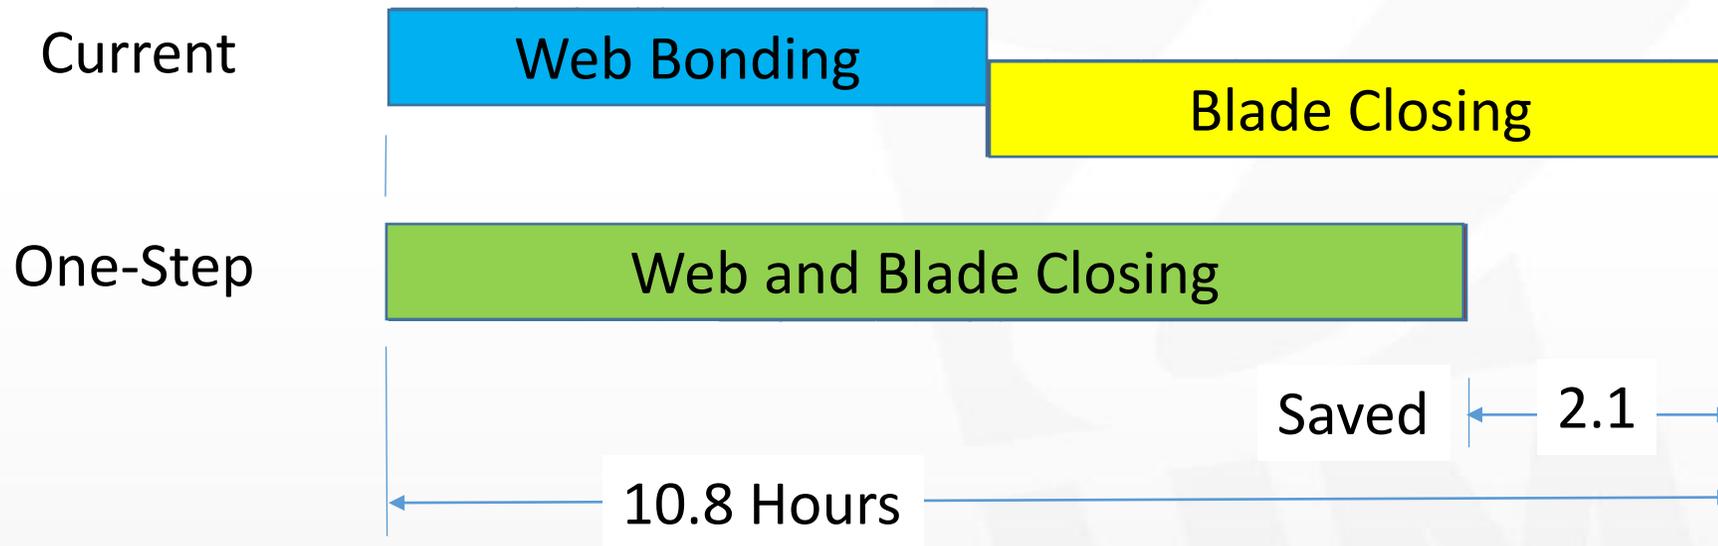

# Case 3 - Automated Finishing

Standard  
Finishing  
Bays

Automated  
Finishing  
Added

# Case 4 – “One-Step” Close

- Immediate Close after setting the shear webs saves >2 hours shell cycle
- Eliminates dispersal and reassembly of work crew while web cure takes place.
- Potentially increases factory output by 10%

TEM Model Predicts \$4,140 (1.9%) Savings per Blade

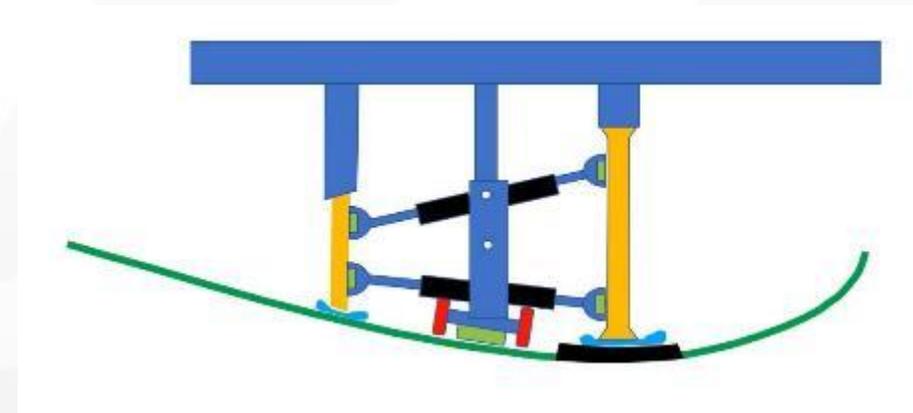

# But, How to make "One-Step" work?

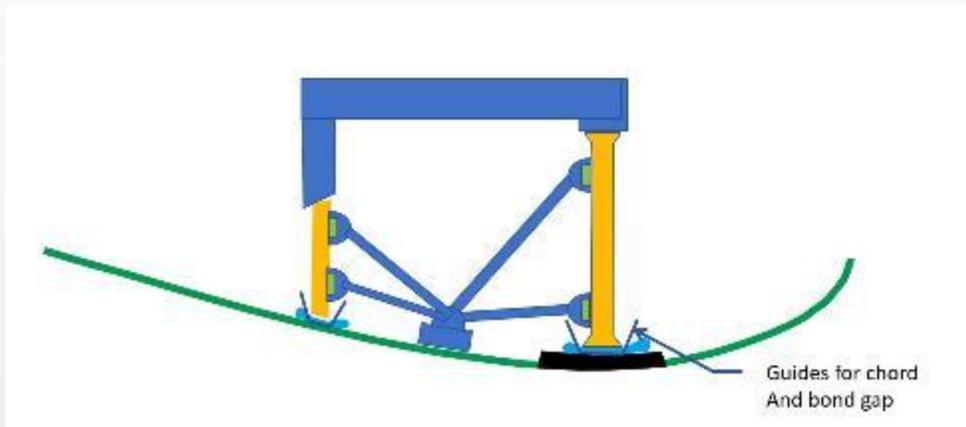

## Two Problems to Overcome:

1. How to locate the webs
2. How to hold them while the adhesive cures

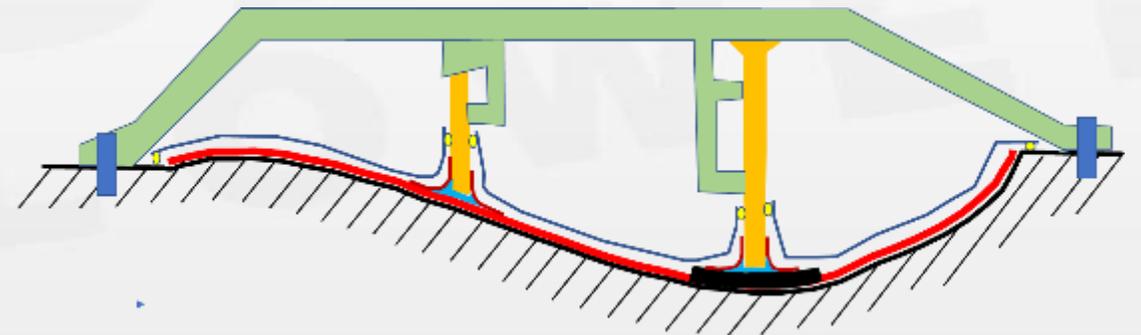

Gantry to locate webs

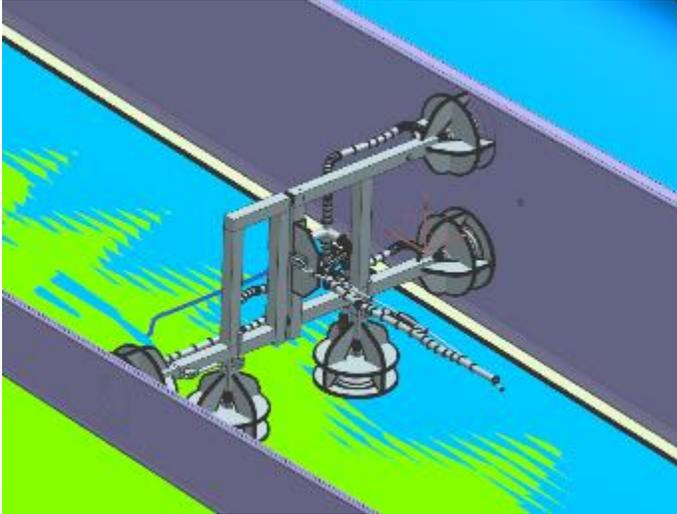

Wedges locate webs

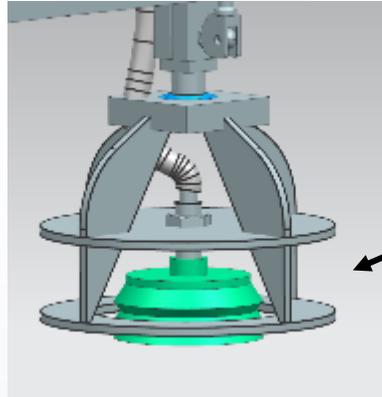

Co-infused Web

# Team Brainstorming & Janicki Engineering

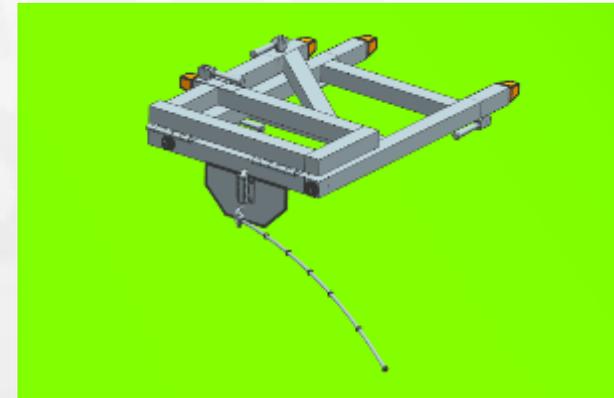

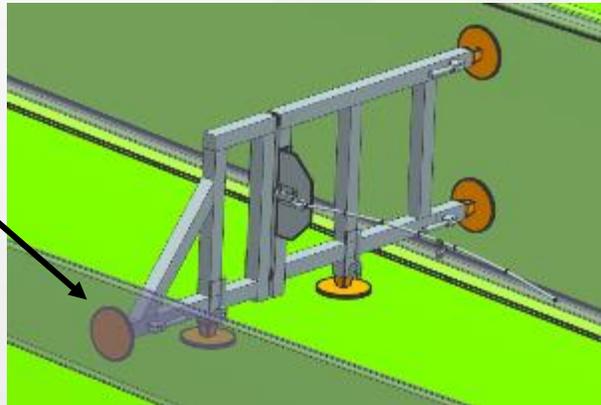

Vacuum Cup Based Attachment

Protective enclosures take loads and prevent damage – cups merely secure the metal against lateral slip

Frangible Tip Based Attachment

Frangible foam sized to breakoff when fixture is unlatched and pulled

# Trials at TPI Warren, RI facility

---

Process and Fixture Testing at TPI's Advanced Transportation and Composites Center included:

- Fixture holding power
- Vacuum cup vs. Frangible
- Simulation and ability to pull fixtures out of closed blade.
- Set webs with "gantry" or
- Set webs with fixtures
- Fixture improvement needs

# Trials at NREL COMET facility

---

Manufacture of three blade tips at the NREL COMET facility enabled:

- Fixture capability
- Fixture functionality
- Co-infusion process validation
  - ✓ Shear web height repeatability
  - ✓ Web bond quality
  - ✓ Incremental time
  - ✓ Incremental consumables

# Case 4 - Conclusions

---

- The TEM Model predicted significant savings
- Technical challenges were overcome with multiple solutions
- Demonstration of the process change
  - ✓ Enabled validation of process improvement
  - ✓ Allowed testing of technical variations
  - ✓ Showed potential further improvements

Demo project validated potential savings and technical viability.

# Thanks to our IACMI Project 4.6/4.8 Partners
